

## Magellan for DIY IoT Development

### Drag, Drop and Orchestrate with Ease

Sirqul's full stack platform with over 70 services is at your fingertips to imagine and build.

Enterprise Development & Innovation Teams

Start-ups and Small Business

OEMs & ODMs

### Efficient. Intelligent. Results Driven.

Sirqul has over 70 services and APIs that can be combined into over 36.47 triginillion ( $3.647 \times 10^{95}$ ) combinations.

Magellan allows developers to drag and drop Sirqul services into a browser-based interface to test and verify code and deploy orchestrations. Building your own combination of services (accessed publically or via private endpoints) allows you to call these "scripts" from remote applications and hardware solutions.

Start with Sirqul's IoT solution templates and extend or build custom IoT applications from scratch with access to the full stack of Sirqul's 70 APIs including: analytics, location, presence, transaction management, personalization, recommendations, messaging, triggers, events, machine learning, "smart mesh" functionality, gamification algorithms and more.
